PROFESSIONAL SUMMARY

Recent data science graduate proficient in Python and SQL, with hands-on experience in data cleaning, experiment evaluation, dashboard development, and model building. Skilled in data validation, cohort analysis, and translating analytical findings into actionable recommendations for product and business stakeholders.

TECHNICAL SKILLS

SQL: Joins, common table expressions (CTEs), Window functions, aggregations
Python: pandas, NumPy, SciPy; data cleaning and exploratory data analysis
Analytics: A/B testing, hypothesis testing, confidence intervals, funnel analysis, cohort analysis, retention metrics
Reporting and tools: Tableau, Excel (PivotTables, VLOOKUP), Git

RELEVANT EXPERIENCE

User Activation and Retention Analysis - SQL, Python (pandas, NumPy), Tableau

URL | August 2026

- Analyzed 100k synthetic product events; defined activation and seven-day retention metrics and compared cohorts by acquisition channel and device type
- Identified the onboarding step with the largest drop-off and proposed an experiment to test an improvement, documenting gaps and limits of observational analysis
- Published reproducible SQL, metric definitions, a dashboard, and a concise dashboard recommendation memo

NBA Shot Selection and Scoring Efficiency - ***SQL, Python (pandas, NumPy), Jupyter,***

spon7ge.github.io/nba-shot-selection/eda_findings.html| May 2026

- Cleaned and analyzed 200k NBA shot records using Python and SQL, validating duplicates, missing values, and shot zone classifications
- Evaluated efficiency differences using confidence intervals and presented 7 findings in a recommendation memo documenting sample-size and contextual limitations
- Built an interactive dashboard comparing shot distribution, effective field goal percentage, and points per attempt across 30 teams

NBA Player Prop Modeling & Market Analysis - ***Python, XGBoost, Hypothesis testing, PostgresSQL, Jupyter***

spon7ge.github.io/statvista | October 2026

- Built numerous XGBoost quantile models that estimates the risk and probability of each player prop comparing against bookmakers implied probabilities
- Cleaned and analyzed 200K+ player rows, handling missing values and duplicates and engineering features for modeling
- Achieved a MAE of 0.190 on a blind 2025-26 holdout of 26k player rows on my points per minute model and MAE of 4.40 on my minutes model

EDUCATION

Bachelor of Science in Data Science - Saint Mary's College of California
May 2026 - 3.8/4.0
Relevant Coursework: Algorithms and Data Structures, Artificial Intelligence, Machine Learning, Natural Language Processing, Data Warehouse, Quantitative Analysis, Database Systems, Data Visualization
